

METHOD, SYSTEM, AND PROGRAM FOR MANAGING  
CLIENT ACCESS TO A SHARED RESOURCE

ABSTRACT

Provided is a method, system, and program for managing client transactions requesting access to a shared resource. Client transactions are logged in a log file from multiple clients. A determination is made of one client transmitting data at a transmission rate less than a threshold transmission rate. Subsequent transactions from the determined client accessing the shared resource are denied to provide additional space in the log file for new transactions from additional clients requesting access to the resource.
